

Changes to ESB-21V1

1. The PA HMA and SMA Design Software #2 is updated and name shortened to ESB DESIGNware. Once you fill in all the aggregate information on the second page, one can use any aggregate plant code and description to pull all the design information over to the trial blends page. Also, there is space for several different oven calibration factors, the 448 fills in automatically from information contained in pages preceding it, and multiple sections exist for different asphalt suppliers in the TSR section.

Note: All data entry on all forms has remained the same. There are no changes to any cells that would require entering data differently from last year.

Note: There are still Excel 4171B's contained within that should not be used any longer unless some old mix or unsupported mix needs to be certified.
